

Referring to Cells by Using a Range Object

See Also

If you set an object variable to a **Range** object, you can easily manipulate the range by using the variable name.

The following procedure creates the object variable `myRange` and then assigns the variable to range A1:D5 on Sheet1 in the active workbook. Subsequent statements modify properties of the range by substituting the variable name for the range object.

```
Sub Random()  
    Dim myRange As Range  
    Set myRange = Worksheets("Sheet1").Range("A1:D5")  
    myRange.Formula = "=RAND()"   
    myRange.Font.Bold = True  
End Sub
```
